• . . .

Combine these using priority queues into a single scheme

# Clause selection: traditionally and neurally

#### Traditionally: simple clause evaluation criteria

- weight: prefer clauses with fewer symbols
- age: prefer clauses that were generated long time ago

• . . .

Combine these using priority queues into a single scheme

#### How to improve this with ML?

- train a <u>classifier</u> for recognizing clauses that appeared in past proofs (as opposed to those selected, but not found useful)
- integrate into the selection mechanism, prioritizing clauses classified positively

# Zooming In

#### Similar to ENIGMA:

- build a classifier for recognising good clauses
- good are those that appeared in past proofs

### Similar to ENIGMA:

- build a <u>classifier</u> for recognising <u>good</u> clauses
- good are those that appeared in past proofs

## Deepire's contributions:

• Learn from clause <u>derivation trees only</u> Not looking at what it says, just who its ancestors were.

#### Similar to ENIGMA:

- build a <u>classifier</u> for recognising good clauses
- good are those that appeared in past proofs

## Deepire's contributions:

- Learn from clause <u>derivation trees only</u> Not looking at what it says, just who its ancestors were.
- Integrate using layered clause queues A smooth improvement of the base clause selection strategy.
- Tree Neural Networks: constant work per derived clause
- A signature agnostic approach
- Lazy evaluation trick (not all derived need to be evaluated)

## Similar to ENIGMA:

- build a <u>classifier</u> for recognising <u>good</u> clauses
- good are those that appeared in past proofs

# Deepire's contributions:

- Learn from clause <u>derivation trees only</u> Not looking at what it says, just who its ancestors were.
- Integrate using layered clause queues A smooth improvement of the base clause selection strategy.
- Tree Neural Networks: constant work per derived clause
- A signature agnostic approach
- Lazy evaluation trick (not all derived need to be evaluated)

## Preliminary Evaluation on Mizar "57880"

- Learn from 63595 proofs of 23071 problems (three 30s runs)
- Deepire solves 26217 (i.e. +4054) problems in a single 10s run

# 3 The Past and the Future of Neural Guidance

# 4 Zooming Out

- Evaluation speed
- Can the choices depend on proof state?
- How exactly is the new advice integrated into the ATP?

< □ > < @ > < \overline > \overline \overlin

- Evaluation speed
- Can the choices depend on proof state?
- How exactly is the new advice integrated into the ATP?

"Looping" typically helps quite a bit!

• basically (a form of) Reinforcement Learning already

◆□ ▶ ◆□ ▶ ◆ ■ ▶ ◆ ■ ⑦ Q ◎ 13/15

- Evaluation speed
- Can the choices depend on proof state?
- How exactly is the new advice integrated into the ATP?

"Looping" typically helps quite a bit!

• basically (a form of) Reinforcement Learning already

## A question to the audience, maybe?

- a classifier (yes/no) seems sub-optimal here
- Are there any good architectures for "unbounded" regressors over recursively defined inputs?

- Evaluation speed
- Can the choices depend on proof state?
- How exactly is the new advice integrated into the ATP?

"Looping" typically helps quite a bit!

• basically (a form of) Reinforcement Learning already

## A question to the audience, maybe?

- a classifier (yes/no) seems sub-optimal here
- Are there any good architectures for "unbounded" regressors over recursively defined inputs?

(Similarly: a fixed number of rounds of message passing in a GCN for an arbitrary formula also does not "feel right".)
